Approved by the World Agricultural Outlook Board. Summary released September 23, 1999. The next summary of Agricultural Income and Finance Situation and Outlook is scheduled for release on December 16, 1999. Summaries and full text of Situation and Outlook reports may be accessed electronically via the ERS website at www.econ.ag.gov/.

The Agricultural Income and Finance Situation and Outlook is published three times a year. To order, call 1-800-999-6779 in the U.S. or Canada. Other areas please call (703) 605-6220. Or write ERS-NASS, 5285 Port Royal Road, Springfield, VA 22161.

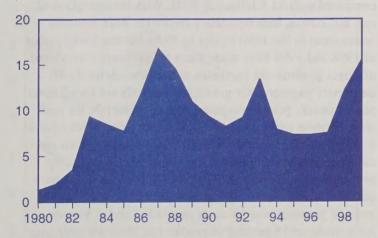

With low commodity prices, 1999 net farm income, forecast at \$43.5 billion, will fall below the revised estimate for 1998 of \$44.1 billion. Direct government payments, an important component of farm income this year, are forecast at \$15.5 billion, second only to 1987's high of \$16.7 billion (figure 1). Loan deficiency payments are forecast at \$5.6 billion and account for the large increase in payments over 1998.

Reductions in 1999 income will fall most heavily on farms that specialize in soybeans, corn, and hogs. Net cash income is projected to drop more than 20 percent from a year earlier on soybean farms. Hog and corn farms are close behind with declines of 18 and 17 percent, respectively. Some farm types will likely see income increase or remain relatively flat during 1999, reminding us of the dynamic status of the U.S. farm economy. Farms that specialize in beef cattle should on average realize income increases of 13 percent from 1998. Poultry and dairy farms are expected to have smaller increases.

Cash-flow problems for farm businesses in 1999 are expected to be most pervasive in three regions of the country-the Heartland, Mississippi Portal, and Southern Seaboard. Given continued low prices for corn and soybeans, average net cash income in the Heartland is expected to be 11 percent lower than in 1998. Nearly 20 percent of farm businesses in this region may not earn enough income to cover expenses, compared with 14 percent in 1998. With an 11-percent decline in average net cash income between 1998 and 1999, 23 percent of farm businesses in the Mississippi Portal region are not expected to cover cash expenses. In the Southern Seaboard region, low prices for tobacco, cotton, and soybeans are expected to reduce average net cash income 12 percent.

Farm Business Assets Revised Downward

ERS has incorporated data from the 1997 Census of Agriculture that include significant revisions in the value of farm real estate assets relative to the 1992 Census and relative to last year's land value survey by the National Agricultural Statistics Service. These revisions affect balance sheet estimates from 1993 through 1998. Since the value of farmland assets is a large share of the total value of farm business assets, the U.S. value of farm business assets and equity has been revised downward over this period.

Many farmers will use additional government payments to reduce financial exposure by paying down debt. Farm debt is expected to stabilize in 1999 at \$172 billion, following increases of 6 percent in 1997 and 4.5 percent in 1998. While the recent rise in debt may cause additional financial difficulty for some farms, it does not indicate widespread financial distress in the farm sector. Nevertheless, farmers are expected to use nearly 60 percent of the debt that can be supported by 1999 income. This would be the highest since 1986, but it remains substantially below 1979-85, when farmers used more that 70 percent of their debt repayment capacity.

Despite the increase in debt in recent years, farm business balance sheets have shown steady improvement throughout the 1990's, especially since 1992. Debt-to-asset ratios have improved, as the 23-percent increase in farm business debt has been more than offset by the 29-percent rise in the value of farm business assets. Farm real estate, which represents the largest component of farm assets, is expected to increase in value in 1999. The increase will be relatively small compared with previous years, reflecting the counterbalancing of lower prices in areas where agricultural uses dominate transactions and those areas where land values are increasing due to urban pressure and other factors. By the end of 1999, U.S. farm equity is expected to be \$864.5 billion—\$9.1 billion above 1998 and over \$48 billion greater than in 1985.

Lower overall input prices helped farmers and ranchers in 1998. Livestock producers were especially helped by lower feed costs, although feed grain producers saw lower receipts. The costs and returns estimates for some commodities will appear different this year than in the past. For corn, soybeans, cotton, peanuts, and cow-calf estimates, ERS is revising its accounting methodology to conform to new standards recommended by the American Agricultural Economics Association. For these five commodities, ERS is also publishing regional estimates using new farm resource regions.

Farm Income Forecast To Decline Only Slightly in 1999

With low commodity prices, 1999 net farm income will fall below the revised estimate for 1998, but will still approach the longer-term decade average.

In late 1997 and 1998, rising world commodity supplies and weak demand reduced farm prices and the value of farm exports. This scenario has continued into 1999. The U.S. government reacted with legislation to increase assistance to farmers, which is helping maintain farm income and tempering financial hardship for many producers. In 1999, supplies of most agricultural commodities have remained large, both from stocks carried over from 1998 and from large crop harvests around the world. Not only has the United States harvested large crops for several years, but so have other major producing countries, such as the European Union, Canada, Australia, Brazil and Argentina.

With low commodity prices, 1999 *net farm income*, forecast at \$43.5 billion, will fall below the revised estimate of \$44.1 billion for 1998 (table 1). On average, cash receipts are forecast to be about \$4.3 billion below those of 1998, the lowest since 1994. Cash receipts will be down \$7.4 billion in 1999 for major field crops—food grains, feed grains, cotton, oil crops, and tobacco (figures 2-7). Cash receipts will be up \$1.5 billion for fruit, vegetable, and greenhouse/nursery crops. Loan deficiency payments to producers of major field crops, such as corn and soybeans, are forecast at over \$5.6 billion for 1999. In 1998, about \$1.8 billion of direct payments were for loan deficiency payments.

5. Cash expenses	169.0	167.8	168.9
6. NET CASH INCOME (4-5)	58.5	55.0	53.3
Farm income statement:			
7. Gross cash income (1+2+3)	227.5	222.8	222.3
8. Nonmoney income	10.6	11.3	11.9
9. Inventory adjustment	0.5	-1.0	-0.5
10. Total gross income (7+8+9)	238.7	233.1	233.6
11. Total expenses	190.0	189.0	190.1
12. NET FARM INCOME (10-11)	48.6	44.1	43.5

Net farm income estimates for both the 1998 and 1999 calendar years are higher because of nearly \$6.0 billion in additional government support as a part of the 1999 Appropriations Act signed into law in October 1998. This additional support, coupled with loan deficiency payments, has provided an important source of income for farms. Direct payments are forecast at \$15.5 billion for the 1999 calendar year, up from the \$12.2 billion paid in 1998 (table 2). As now projected, 1999 payments would be second only to the 1987 high of \$16.7 billion.

In contrast to crops, livestock cash receipts are expected to reach their second highest level of the 1990's, rising more than \$1.5 billion from 1998 to 1999. With the exception of hogs, livestock receipts are generally improving in 1999. Beef production is up in 1999 and dairy prices turned sharply upward at midyear. Poultry receipts are up slightly, continuing a long-term trend. Hogs continue to be produced in abundance, largely due to structural change occurring in the industry. Investments in large processing plants are stimulating regional increases in production, which raise national supplies and lower prices. Prices will continue under pressure until the necessary adjustments in overall supplies are made, or demand rises significantly.

Government Payments Become an Important Component of Revenues

Continued low prices for major commodities will generate a notable increase in 1999 loan deficiency payments from 1998. Forecasts based on current price expectations indicate that 1999 loan deficiency payments will be \$5.6 billion, compared with \$1.8 billion in 1998. With the exception of rice and cotton, loan deficiency payments were virtually nonexistent in the 1990's prior to 1998, but the lower prices in 1998 and 1999 have made them a significant component of direct government payments to the farm sector. Loan deficiency payments for grains and oilseeds are based upon posted county prices compared with the loan rate for each area. Farmers may request loan deficiency payments equivalent to the difference between the posted county price and the loan rate for the quantity they have produced. In any given year, some areas may be eligible for loan deficiency payments and others may not. For the 1998 corn crop, the average payment was 18 cents per bushel and payments were made on 58 percent of production. Both a higher aver-

F = forecast.

1/ Final sector output is the gross value of the commodities and services produced within a year. Net value-added is the sector s contribution to the National economy and is the sum of the income from production earned by all factors-of- production. Net farm income is the farm operators share of income from the sector's production activities. The concept presented is

A negative value is an offset to production from prior years included in current-year sales. consistent with that employed by the Organization for Economic Cooperation and Development. 2/ A positive value of inventory change represents current-year production not sold by December 31. age payment and a greater share of production covered in 1999 will boost loan deficiency payments for corn and other major commodities.

The "Omnibus Consolidated and Emergency Supplemental Appropriations for Fiscal Year 1999" Act of October 1998 included about \$5.6 billion in direct government payments for the farm sector. About half of that amount was intended as supplemental payments, which helped offset the loss of overseas markets and lower commodity prices. An amount of \$2.8 billion was disbursed in one-time supplemental payments by the end of calendar 1998. The remainder was appropriated as disaster payments to assist farmers who had suffered crop losses due to severe climatic conditions in 1998 and prior years. The disaster payments are likely to be disbursed during calendar 1999.

Production flexibility payments set forth in the 1996 Farm Act will trend downward in 1999, as set forth in the legislation. Production flexibility payments are authorized by fiscal years, which begin on October 1. The farmer has an option of taking a portion of the total payment prior to December 31, or taking all of the payment in the forthcoming calendar year. Consequently, the forecast of \$5.1 billion in production flexibility payments for 1999 comes from amounts budgeted for fiscal years 1999 and 2000. The forecast presumes that about 20 percent of fiscal year 2000's appropriated funds will be taken by December 31, 1999, and the remainder will fall within the next calendar year.

The total expected government payments for 1999 of \$15.5 billion would be the highest amount since expenditures of \$16.7 billion in 1987. In 1987 government payments were equivalent to 10 percent of gross cash revenues, falling to 5 percent in 1998 (table 3). As forecast for 1999, government payments could reach 7 percent of cash revenues. Until now, the largest total of government payments in the 1990's was \$13.4 billion in 1993.

After Falling in 1998, 1999 Production Expenses Return to 1997's Record

In 1999, total production expenses are forecast at \$190.1 billion, up 1.1 percent from 1998 and equal to the record set in 1997. Overhead and feed are the largest single expenses in 1999 (figure 8). The drop in 1998 production expenses was only the second significant drop since the 6-percent declines that occurred in both 1985 and 1986.

Total expenditures for the principal crop inputs, seeds, fertilizer, and pesticides, are projected to be \$26.7 billion, down 1.1 percent from 1998. Expenditures for pesticides and seeds are nearly the same, while fertilizer expenses are forecast down 2.8 percent.

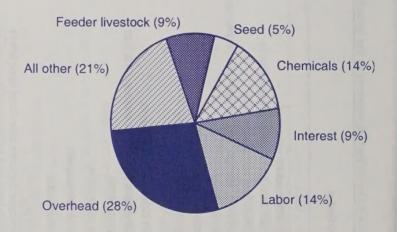

The most significant increase in annual prices paid will be in fuels, which are currently forecast to rise around 14 percent. Oil futures are currently above \$20 per barrel and certain domestic refineries have been experiencing production problems. However, the final level is uncertain at this point. Interest expenses are projected up 0.6 percent, the smallest increase since 1993. ERS is currently forecasting 1999 interest rates to be about the same as in 1998.

How Loan Deficiency Payments Work

Producers may apply for a loan deficiency payment (LDP) whenever the posted county price for an eligible commodity is less than the local loan rate established for Commodity Credit Corporation (CCC) non-recourse loans.

- Eligible commodities—Wheat, corn, grain sorghum, barley, oats, soybeans, minor oilseeds, rice, and upland cotton are eligible for payments.
- Eligible producers—To be eligible for LDPs producers must meet certain basic criteria, mainly:
 - a) Producers must have control of their commodity, bear the risk of its loss, and have title to the quantity for which they request an LDP.
 - b) Producers must have a Production Flexibility Contract to receive payments for wheat, feed grains, upland cotton, and rice. However, producers without Production Flexibility Contracts can receive LDPs for oilseed crops.
 - c) Producers must comply with applicable conservation and wetland protection requirements.
 - d) The crop musts not be under loan.
- Amount of the LDP—Loan rates and prices are established for the local level.
 - a) Loan rates are established annually at the national level based on formulas and statutory limits. National loan rates for commodities, except rice, are then adjusted to the local level (county or warehouse) to reflect spatial differences in markets, transportation costs, and other factors.
 - b) The loan rate formula for wheat, corn, and soybeans is 85 percent of the average price in the 5 previous marketing years, excluding the highest and lowest prices for those years, but not exceeding statutory limits. These limits are a maximum of \$2.58 per bushel for wheat, \$1.89 for corn, and no lower than \$4.92 nor higher than \$5.26 for soybeans. Loan rates for other feed grains are based on the formula for corn. The loan rate for rice is fixed at \$6.50 through 2002. The upland cotton formula is the most complex and includes consideration of world prices.
 - c) The applicable local price (technically the "alternative loan repayment rate") for wheat, feed grains, and oilseeds reflects CCC's estimates of a local market price for each of these commodities. This price is commonly known as the posted county price. Upland cotton and rice prices are based upon the world price adjusted to the United States.
- Getting an LDP—When the alternative loan repayment rate is lower than local loan rate, the farmer may apply for an LDP based on this difference times the quantity of the commodity that otherwise could have been placed under a non-recourse CCC loan. When the producer receives an LDP, it is in lieu of securing a nonrecourse loan.

For additional background on loan deficiency payments consult USDA's Farm Service Agency's website at http://www.fsa.usda.gov

On the demand side, feed use should increase less than 1 percent as decreasing inventories of cattle and hogs in 1999 will nearly offset continued growth in the poultry sector. Slightly lower acreage planted in principal crops has lowered demand for crop production inputs.

Forecast 1999 feed expenses are \$24.1 billion, down 3.7 percent from 1998. Feed expenses have fallen in 1998 and 1999 primarily because of the continuing drop in feed prices that began with the 1996 harvest. The principal factor influencing feed demand in 1999 will be the fall in the number of cattle on feed. The reduced supply of feeder cattle is being held outside feedlots to higher weights because pasture conditions have improved and increased hay production has lowered prices. Also, cow and heifer slaughter will move toward normal levels as producers begin to retain

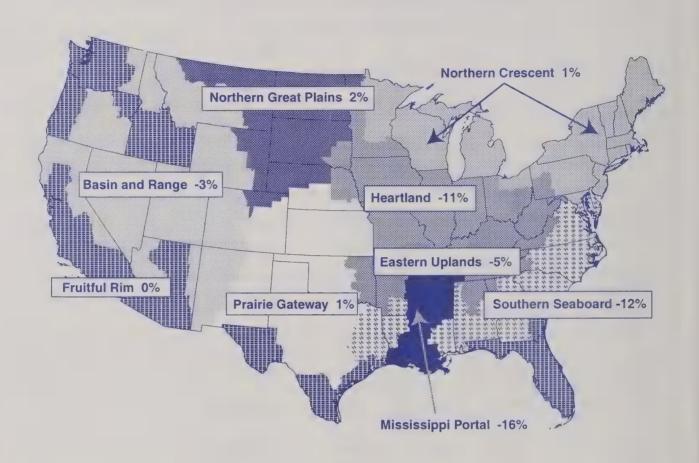

heifers for herd expansion. Hog inventories on March 1, 1999, were below a year earlier and pork production will finally fall below year-earlier levels in the fourth quarter of 1999. Milk production is expected to increase around 3 percent in 1999 as producers catch up with demand and hay prices fall. Despite lower exports, lower feed prices have kept broiler returns very favorable. Broiler production is forecast to rise 6.5 percent in 1999.

Regional Outlook for U.S. Farm Businesses

Cash-flow problems for farm businesses in 1999 are expected to fall most heavily on three regions of the United States—the Heartland, Mississippi Portal, and Southern Seaboard (figure 9). Given continued low prices for corn and

Figure 9

Projected change in average farm business net cash income, 1998-99

soybeans, average net cash income in the Heartland is expected to be 11 percent lower than in 1998. Nearly 20 percent of farm businesses in this region may not earn enough income to cover expenses in 1999, compared with 14 percent in 1998. Farm businesses in the Mississippi Portal are also expected to experience cash shortfalls in 1999. Higher direct government payments in the form of loan deficiency payments (LDPs) are not enough to offset lower receipts for cotton, rice, and soybeans. Average net cash income is expected to fall 16 percent from 1998. As in 1998, 23 percent of the region's farm businesses are not expected to cover cash expenses. In the Southern Seaboard region, low prices for tobacco, cotton, and soybeans are expected to reduce average net cash income 12 percent. Cash-flow problems could deteriorate further given the prolonged drought, particularly in the northern half of the region.

Unexpected declines in farm business earnings have led to debt repayment problems in several regions. Farm businesses in the Northern Great Plains and Prairie Gateway regions have had persistent debt repayment problems. Cash income will not support debt payments for 18 percent of farm businesses in the Northern Great Plains in 1999, a result similar

to both 1997 and 1998. In the Prairie Gateway 17 percent of farm businesses are expected to have debt repayment difficulty, slightly more than in 1998, but well below 1997. In the Mississippi Portal region, the share of farm businesses with debt repayment difficulties is expected to have doubled since 1997, reaching nearly 18 percent by 1999.

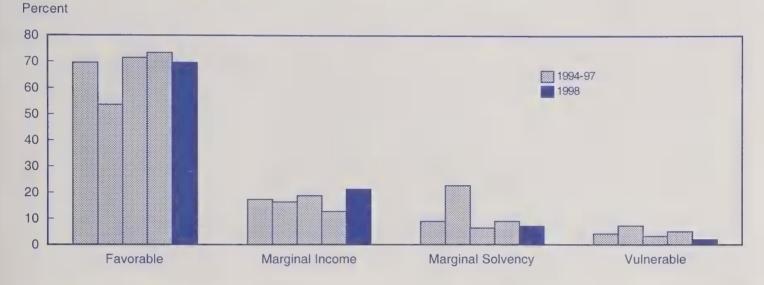

Commodity Specialization Outlook for U.S. Farm Businesses

Reflecting changes in commodity and input prices and production, 1999 net cash income is projected to drop by about 18 percent from a year earlier on soybean farms (figure 10, table 4). Hog and corn farms are close behind with declines of 12 and 15 percent, respectively. Key determinants of income adjustment of these farms are similar and include crop receipts that are expected to be 10 percent or more below those of 1998, an increase of more than a fourth in government payments, and expenses that remain almost flat with the previous year. In all cases, the increased payments are insufficient to offset the drop in commodity receipts. With tighter cash flows, a higher proportion of these farms will experience debt repayment problems. This is particu-

larly true for corn farms, reflecting the relatively high debt use by this farm type. Some farm types will likely see income increase or remain relatively flat during 1999, reminding us of the dynamic status of the U.S. farm economy. Farms that specialize in beef cattle should on average

realize income increases of 13 percent from 1998. Poultry and dairy farms are expected to have much smaller increases. Key determinants of income for these farms are expected increases in livestock receipts and flat expenses, reflecting lower feed costs.

ERS Constructs New Regions

The U.S. farm sector consists of a highly diverse set of businesses and farm households committed to living in rural areas and engaging in farm economic activities. Since the early 1900's, USDA analysts have sought to identify patterns in U.S. farming that might increase understanding of differences in financial performance of farms and the economic well being of farm households.

USDA's Economic Research Service (ERS) recently constructed a new set of regions depicting geographic specialization in the production of U.S. farm commodities. The new regions recognize both new capabilities and more relevant data, and overcome some longstanding problems with the older USDA Farm Production Regions. The new ERS regions are derived from four sources: the Farm Production Regions, a cluster analysis of U.S. farm characteristics, the USDA Land Resource Regions, and National Agricultural Statistics Service (NASS) Crop Reporting Districts. Electronic files linking counties to the new Farm Resource Regions are online at the ERS website (www.econ.ag.gov/whatsnew/issues/regions).

Background

County clusters, based on types of commodities produced, have shown that a few commodities tend to dominate farm production in specific geographic areas that cut across State boundaries. The climate, soil, water, and topography in localized geographic areas tend to constrain the types of crops and livestock that will thrive there.

The older Farm Production Regions, in following State boundaries, necessarily group unlike areas together because a single State often encompasses different soils and typography. For example, the old Appalachian region, comprised of Tennessee, Kentucky, North Carolina and Virginia, contains the Appalachian Mountains, Piedmont, and Coastal Plain areas, all of which have quite different agriculture.

In constructing the new regions, ERS analysts identified where areas with similar types of farms intersected with areas of similar physiographic, soil, and climatic traits, as reflected in USDA's Land Resource Regions. ERS analysts then conformed these intersecting areas to follow the boundaries of NASS Crop Reporting Districts, which are aggregates of counties. With more data available at the county level, geographic representations need no longer follow State boundaries.

The new Farm Resource Regions, by more accurately portraying the geographic distribution of U.S. farm production, will help analysts and policymakers better understand economic and resource issues affecting agriculture.

J.E. Sommer and F.K. Hines. Diversity in U.S. Agriculture: A New Delineation by Farming Characteristics. AER-646, ERS, USDA, 1991.

Basin and Range

- · Largest share of nonfamily farms, smallest share of U.S. cropland.
- 4% of farms, 4% of value of production, 4% of cropland.
- · Cattle, wheat, and sorghum

Northern Great Plains

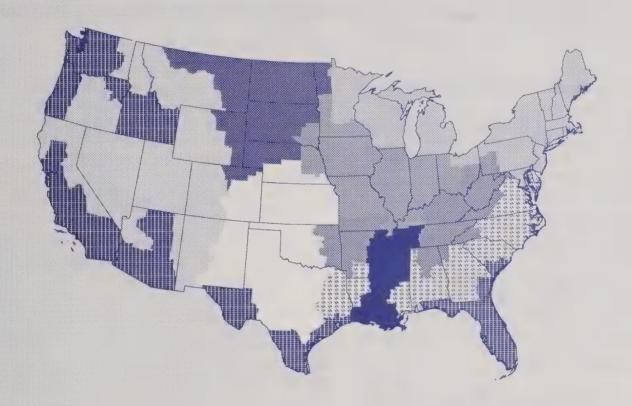

- · Largest farms and smallest population.
- 5% of farms, 6% of value of production, 17% of cropland.
- · Wheat, cattle, and sheep farms

Heartland

- Most farms (22%), highest value of production, (23%), and most cropland (27%).
- · Cash grain and cattle farms.

Northern Crescent

- · Most populous region.
- 15% of farms, 15% of value of production, 9% of cropland.
- Dairy, general crop, and cash grain farms.

Fruitful Rim

- Largest share of large and very large family farms and nonfamily farms.
- 10% of farms, 22% of value of production, 8% of cropland.
- Fruit, vegetable, nursery, and cotton farms.

Prairie Gateway

- ·Second in wheat, oat, barley, rice, and cotton production.
- •13% of farms, 12% of value of production, 17% of cropland.
- *Cattle, wheat, sorghum, cotton, and rice farms.

Mississippi Portal

- Higher proportions of both small and lager farms than elsewhere.
- 5% of farms, 4% of value of production, 5% of cropland.
- Cotton, rice, poultry, and hog farms.

Southern Seaboard

- Mix of small and larger farms.
- 11% of farms, 9% of value of production, 6% of cropland.
- Part-time cattle, general field crop, and poultry farms.

Eastern Uplands

- Most small farms of any region.
- = 15% of farms, 5% of value of production, and 6% of cropland.
- Part-time cattle, tobacco, and poultry farms.

Sixty-four Percent of Surveyed Farmers Reported Entering 1999 in a Favorable Financial Position

In the 1998 Agricultural Resource Management Study, U.S. farmers and ranchers reported that they were financially holding steady with the previous year. The proportion of favorable operations varied by region.

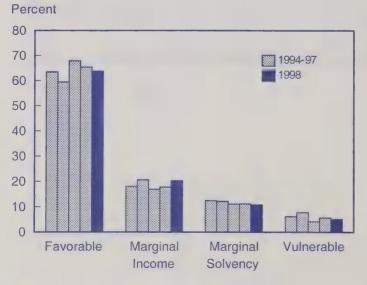

ERS, in collaboration with USDA's National Agricultural Statistics Service, conducts an annual survey of farm and household finances. Since 1986, results of this survey have been used to establish estimates of farm financial position, considering both net income and degree of indebtedness. Results reported here are from the 1998 calendar year and are based on personal surveys with farm operators in February-April 1999.

On January 1, 1999, USDA classified 5.1 percent of commercial farm businesses as being in a vulnerable financial position based on their combined net farm income and debt/asset ratios (figure 11). The share of vulnerable farms was similar to a year ago when 5.6 percent were considered financially vulnerable. There was a 4.1-point reduction in the proportion of farm businesses considered to be in a favorable financial position, below the 1997 peak of 67.9 percent, but above 1995's 59.4 percent.

The largest decline in the share of favorable farm businesses occurred in the Eastern Uplands (16 percentage points), Mississippi Portal (15 percentage points), and the Basin and

Pigure 11

Distribution of farm businesses by overall financial performance

Source: Agricultural Resource Management, ERS, USDA.

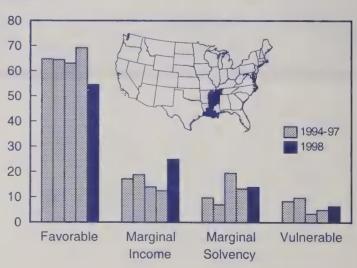

Range (13 percentage points). The percentage of farms in a favorable financial position increased in the Northern Crescent Region. Compared with other regions, the Mississippi Portal had the lowest proportion of farm businesses in a favorable financial position at 54.5 percent (figure 12). A year ago, the Prairie Gateway held this distinction. As at the beginning of 1998, the Prairie Gateway and Northern Great Plains regions began 1999 with the highest shares of financially vulnerable farms.

The largest reductions in the share of financially favorable farms occurred in farm businesses that specialized in the production of cotton (down 11 percentage points), poultry (11 percentage points), and hogs (9 percentage points). Only 43.4 percent of hog farms were classified as financially favorable at the beginning of 1999, the lowest among all farm types. In contrast, 88.7 percent of tobacco and 74.1 percent of dairy farms were considered financially favorable. More than one in ten farms that specialized in the pro-

Figure 12

duction of vegetables, fruit, and hogs were in a vulnerable financial position at the beginning of 1999.

Farm Business Income

The most comprehensive measure of farm business earnings, net farm income, declined from an average of \$58,951 in 1997 to \$57,706 in 1998 (table 5). Average gross cash income increased 10 percent with all major sources higher than in 1997. In relative terms, government payments increased the most, going from \$8,483 per farm in 1997 to \$14,694 in 1988. Farm costs were also higher, with 1998 cash expenses 5 percent above the 1997 average. Lower outlays for feed, livestock purchases, and fuel were more than offset by higher expenses for seed, fertilizer and chemicals, labor, and repairs and maintenance. All categories of fixed costs were higher in 1998, with the largest increases occurring for interest and rent and lease payments.

Higher government payments did not fully offset the impact of low grain prices on net farm income. Farms that specialized in the production of soybeans had the largest year-toyear decline in net farm income (50 percent) followed by cotton (36 percent) and wheat (22 percent). Regional impacts of low prices reflect the concentration of commodity production. The Mississippi Portal, which has a high concentration of cotton and soybean production, had the largest decline in net farm income between 1997 and 1998. Other regions with declines included the Eastern Uplands, Heartland, and Prairie Gateway.

The share of commercial farm businesses that had positive net farm income declined from 76.6 percent in 1997 to 74.6 percent in 1998. The lowest percentage during the 1990's

Table 5--Financial data for farm businesses, 1997-98

Item	1997	1998
	\$ per op	eration
Income statement		
Gross cash income	278,688	306,356

Data for farms reporting sales of \$50,000 or more.

Source: Agricultural Resource Management Study.

was in 1995, when 71.6 percent of farm businesses reported positive income.

At the beginning of 1999, only three regions had less than 70 percent of farm businesses with positive net farm income: the Northern Great Plains (67 percent), Basin and Range (65 percent), and the Mississippi Portal (69 percent). Farms specializing in hog production had the lowest proportion of farm businesses with positive net farm income in 1998 at 59 percent. Cotton (69 percent), fruit (65 percent), vegetable (68 percent), cattle (67 percent), and other livestock (66 percent) were the other farm types with a relatively low share of farms with positive net farm income.

Farm Business Balance Sheet

The financial position of commercial farms, as measured by the debt/asset ratio, has slowly improved during the last 5 years, going from an average of 18 percent in 1994 to the current estimate of 16 percent for 1998. Average assets and liabilities of farms with gross sales of \$50,000 or more increased in 1998. Land and buildings contributed most of the increase in total assets. Land and buildings represented 64 percent of total assets and their value increased 18 percent in 1998 to nearly \$695,000 per farm. Current assets also rose in 1998 due to increases in items such as crop inventories, accounts receivable, and checking account balances. Most of the increase in debt came from noncurrent obligations related to land and machinery purchases, which represented two-thirds of the \$170,728 average total debt.

The Northern Crescent and Basin and Range were the only regions where average debt declined between 1997 and 1998. Farm businesses in the Mississippi Portal, Eastern Uplands, and Prairie Gateway regions incurred the largest debt increases. These were the only regions where the average debt/asset ratio increased since 1997. At the end of 1998, the highest average debt/asset ratios were for farms in the Heartland (0.18), Prairie Gateway (0.19), and Mississippi Portal (0.18) regions.

Average farm business debt declined between 1997 and 1998 for farms that specialized in the production of wheat and cotton. These farm types have traditionally been more leveraged relative to other commodity specializations. The debt/asset ratio for cotton farms averaged 0.16 in 1998, well below the peak of 0.26 in 1996. Corn, tobacco, and poultry were the only farms that had an increase in average debt/asset ratios. Hog and poultry farms were more highly leveraged than other farm types, averaging debt/asset ratios of 0.30 and 0.27, respectively, at the end of 1998. Vegetable farms had the highest average debt/asset ratio among crop production specialties at 0.21.

Farm Household Incomes Remain Steady

Despite declining farm income, the incomes of farm operator households, on average, should remain about steady for 1999.

The forecast for 1999 indicates farm household income should be approximately the same as in 1998, even though average farm earnings per household are forecast to decline (appendix table 2). On average, farm operator households received \$59,700 in total income in 1998, mostly from off-farm sources (\$52,600 per household). Operator household income consists of all the income received by the operator household from farm and off-farm sources (table 6).

Table 6--Deriving farm operator household income, 1998

Item	
	Dollars per farm
Net cash farm business income 1/	14,357
Less depreciation	7,409
Less wages paid to operator and gross farmland rental income	1,180
Less adjusted farm business income due to other households	1,332
	Dollars per operator household
Equals adjusted farm business income	4,436
Plus wages paid to operator, net farmland rental income, and other farm-related earnings	2,670
Equals earnings of the operator household	
from farming activities	7,106
Plus earnings of the operator household	
from off-farm sources	52,628
Equals average farm operator household income	59,734

Note: This table derives farm operator household income estimates from the Agricultural Resource Management Study (ARMS) that are consistent with Current Population Survey (CPS) methodology. The CPS, conducted by the Census Bureau, is the source of official U.S. household income statistics. The CPS defines income to include any income received as cash. The CPS definition departs from a strictly cash concept by including depreciation as an expense that farm operators and other self-employed people subtract from gross receipts when reporting net cash income. See appendix table 2 for more detailed information about how farm operator household income is derived.

1/ A component of farm sector income. Excludes income of contractors and landlords as well as the income of farms organized as nonfamily corporations or cooperatives and farms run by a hired manager. Includes the income of farms organized as proprietorships, partnerships, and family corporations.

Source: U.S. Dept. of Agriculture, Economic Research Service, 1998 Agricultural Resource Management Study (ARMS).

The forecast of total operator household income is not highly sensitive to forecast farm sector income because, on average, farm earnings make up only a small share of total operator household income (figure 13). Most U.S. farms are very small, because only \$1,000 of gross agricultural sales are necessary to qualify as a farm. Approximately half of all farms have less than \$10,000 in gross sales. Households operating these very small farms necessarily rely on off-farm income.

Between 1997 and 1998 (the last year for which survey data are available), there was a statistically significant increase in average total household income and income from off-farm sources.

Reliance on Farming for Income Varies

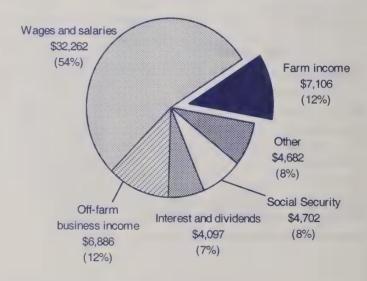

Nevertheless, some farm households do depend on income from farming. Reliance on farming varies widely across the farm typology developed by ERS. The farm typology categorizes farms into more homogeneous groups, based largely

Figure 13

Sources of income for average farm operator household, 1998

Earnings from the farm average 12% of total farm household income

Average operator household income = \$59,734

on occupation of the operator and sales class of the farm (see the box, Defining the Farm Typology).

Four groups of small farms—limited-resource, retirement, residential/lifestyle, and lower-sales-rely on off-farm sources for virtually all their income (figure 14). They actually lose money from farming, on average. Because these four groups make up 82 percent of all U.S. farms (figure 15), they pull the national average earnings from farming down to \$7,100. Excluding the four groups, average earnings from farming would be \$61,300.

Agricultural production by the four groups is low. Although they form an overwhelming majority of all farms, they account for only 16 percent of the value of agricultural production. In contrast, higher-sales small farms alone account for a similar share (17 percent) of production, with only 8 percent of farms. And, the large and very large farms groups together provide 53 percent of production, also with 8 percent of farms.

These last three groups—higher-sales small farms, large family farms, and very large family farms—all have positive average earnings from farming, and farm earnings increase among these groups as farm size increases (figure 14). The share of household income from farming also increases with

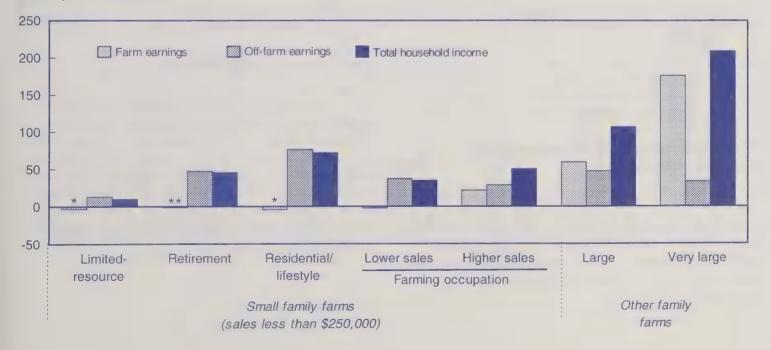

farm size, ranging from 43 percent of total household income for higher-sales small farms to 56 percent for large family farms and 84 percent for very large family farms. Note that households in these three groups also receive substantial off-farm income, on average. For example, households operating very large farms receive an average of \$33,200 from off-farm activities, although most of their income comes from farming.

Earnings of the operator household from farming activities are not a complete measure of economic well-being provided by the farm, however. They omit some resources the farm business makes available to the household. For example, depreciation is an expense deducted from income that may not actually be spent during the current year. Depreciation averages \$7,400 per family farm, but can be much higher for some farms. It averages \$17,000 for highersales small farms, \$34,600 for large family farms, and \$67,700 for very large family farms.

In addition, earnings of the operator household from farming activities do not reflect the large net worth of many farm operator households. Much their net worth is illiquid and not readily available for spending, since it is largely based on assets necessary for farming. However, some assets such as inventories of livestock not used for breeding and

Defining the Farm Typology

Small Family Farms (sales less than \$250,000)=

- Limited-resource. Any small farm with: gross sales less than \$100,000, total farm assets less \$150,000, and total operator household income less than \$20,000. Limited-resource farmers may report farming, a nonfarm occupation, or retirement as their major occupation.
- Retirement. Small farms whose operators report they are retired (excludes limited-resource farms operated by retired farmers).
- Residential/lifestyle. Small farms whose operators report a major occupation other than farming (excludes limitedresource farms with operators reporting a nonfarm major occupation).
- Farming occupation/lower-sales. Small farms with sales less than \$100,000 whose operators report farming as their major occupation (excludes limited-resource farms whose operators report farming as their major occupation).
- Farming occupation/higher-sales. Small farms with sales between \$100,000 and \$249,999 whose operators report farming as their major occupation.

Other Farms

Large family. Farms with sales between \$250,000 and \$499,999.

Very large family. Farms with sales of \$500,000 or more.

Nonfamily. Farms organized as nonfamily corporations or cooperatives, as well as farms operated by hired managers.

inventories of crops—are liquid. Average livestock and crop inventories are \$24,800 for all family farms, but are much higher for higher-sales small farms (\$62,600), large family farms (\$113,500), and very large family farms (\$196,000).

Farms Account for Most Operator Household Wealth

Although many farm households rely heavily on off-farm sources for income, most operator household wealth comes from the farm, regardless of typology group (figure 16). The farm accounts for the smallest share of household net worth in the residential/lifestyle group, about 74 percent. Even for this group, however, the overwhelming majority of net worth comes from the farm.

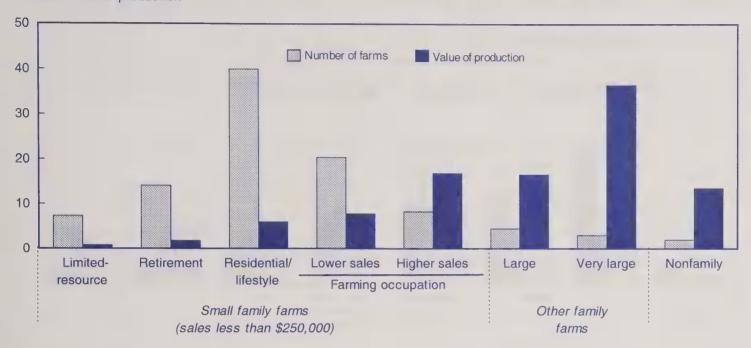

Environmental Implications

Although the five groups of small farms collectively account for only one-third of agricultural production, they have a disproportionate impact on the environment. Small farms hold about two-thirds of farm assets, including land (figure 17). Thus, they play a major role in natural resource and environmental policy. For example, small farms have about 84 percent of the land enrolled in the Conservation Reserve and Wetlands Reserve Programs (CRP and WRP). Retirement and residential/lifestyle farms alone account for half the land in the programs.

^{*}The \$250,000 cutoff for small farms was suggested by the National Commission on Small Farms.

Farm Debt Expected To Stabilize in 1999

Following increases of 6 percent in 1997 and 4.5 percent in 1998, farm debt may decline slightly in 1999. Many farmers will use anticipated record levels of government payments to reduce financial exposure by paying down debt.

Farm business debt is expected to stabilize in 1999. If the anticipated slight decline materializes, it will end 6 consecutive years of increases. With an expected decline of less than \$200 million, farm debt is expected to remain above \$172 billion at the end of 1999. Farm debt reached \$172.8 billion in 1998, the highest since 1985. A modest contraction in outstanding loan balances in 1999 would follow debt rises of \$9.4 billion in 1997 (6 percent) and \$7.4 billion (4.5 percent) in 1998, the largest consecutive annual increases since 1980.

While low commodity prices have reduced the cash receipts component of farm operators' incomes, additional government assistance will provide replacement funds to allow most farmers to meet their current debt service needs. Many lenders felt that farmers were able to meet 1998's debt obligations only because of government emergency assistance payments last fall. These lenders also have expressed concern that many of their borrowers would experience severe repayment problems in 1999 in the absence of a similar emergency-funding package this year. It now appears likely that some form of additional government assistance will be forthcoming. Lenders are likely to exercise restraint in taking action against delinquent borrowers, anticipating that loan payments will be made, if slightly later than original loan terms specified.

In general, given the current large world stocks of grains, oilseeds, and cotton, prices cannot be expected to rebound dramatically in the near future. The prospect of cash receipts continuing near or below 1999 levels, coupled with uncertainty surrounding future government emergency assistance, is a cause of concern in the agricultural finance community. Indebted farm operators, encouraged by their lenders, will likely apply any surplus cash included in the ultimate 1999 assistance package to improve their balance sheets, reducing debt to limit financial exposure to future economic adversity.

Sector-wide net cash income in 1999 is expected to be about 4 percent below 1998, and down almost 10 percent from its 1997 record. The impacts of this decline have not been evenly distributed across all U.S. farm operations, and producers specializing in wheat, corn, soybeans, and hogs will likely continue to experience higher levels of financial stress in 1999.

Banks Provide 40 Percent of Agricultural Credit

Commercial banks are the largest source of credit for U.S. farmers, providing over 40 percent of the agricultural loan volume outstanding at the end of 1998 (table 7). Farm debt held by banks is expected to rise slightly in 1999, following an increase of almost 5 percent in 1998. Banks' share of the total farm debt market has increased over the past 10 years from less than 31 percent to almost 41 percent. While bank real estate loans (those secured by farmland) have risen rapidly in recent years, nonreal estate loans accounted for over 61 percent of bank loans to farmers at the end of 1998.

Examination of bank farm loan portfolios should give some indication of the financial condition of farm operations. Bankers have reported that, using market prices prevailing in the late summer of 1999, current credit analysis of producers of many commodities suggests that a growing number of borrowers may have difficulty cash flowing loans in the absence of additional government assistance. However, any deterioration in farm financial conditions has not been reflected in the performance of banks' farm nonreal estate loan portfolios through the first quarter of 1999. (Data are reported by banks in call reports filed with the Federal Reserve Bank.) Performance of bank real estate loan portfolios, reported only since 1992, show similar results. The reports suggest a sound current farm loan portfolio, compared to both other sectors of the economy and to previous periods of farm financial stress.

Bank charge-off rates, which reached 3.36 percent of nonreal estate loans in 1986, remained below 0.2 percent in the first quarter of 1999 (figures 18 and 19). In contrast, nonagricultural commercial bank consumer loan charge-offs typically run in excess of 2 percent. In comparison, consumer credit card charge-off rates have exceeded 4 percent annually since the late 1980's, and are currently above 6 percent.

Guaranteed loans, which were not widely available during the mid-1980's, will make over \$2.7 billion available in 1999, with almost \$2 billion of this targeted for nonreal estate loans. This suggests that banks are not likely to suffer significant losses in 1999. Charge-offs will likely not rise during the remainder of 1999, as banks are now likely to move less

quickly to resolve problem loans, awaiting the final passage of a government farm financial assistance package.

Agricultural banks entered 1999 well capitalized, reporting ample funds to meet the credit needs of qualified borrowers. However, bank officers responding to first-quarter 1999 surveys conducted by the Federal Reserve Banks of Minneapolis, Chicago, Kansas City, Dallas, and Richmond indicate widespread concern. While more bankers in each region report a softening in farmers' demand for loans relative to a year earlier, and most reported higher availability of funds for qualified borrowers, most also reported lower loan repayment rates, higher numbers of renewals and extensions, and increased collateral requirements.

Farmers' Use of Repayment Capacity To Rise in 1999

While the rise in debt in recent years may cause additional financial difficulty for some farm operators, it does not indicate widespread financial distress in the farm sector. Nevertheless, farmers are expected to use their available credit lines more fully in 1999. Lenders generally require that no more than 80 percent of a loan applicant's available income be used for repayment of principal and interest on loans. For farm operators, this income available for debt service (measured as net cash income plus interest) can be used to determine the maximum amount of loan payment the farmer could make. Given current market interest rates and

an established repayment period, the maximum debt that the farmer could carry with this loan payment can be determined. Using current bank interest rates and a 7-year repayment period, maximum feasible debt conceptually measures the line of credit that could be available to farmers.

Debt repayment capacity utilization (actual debt expressed as a percentage of maximum feasible debt) effectively measures the extent to which farmers are using their available lines of credit. This ratio indicates that, in 1999, farmers are expected to use over 59 percent of the debt that could be supported by their current incomes (figure 20). This is the highest since 1986, but it is substantially below 1979-85, when farmers consistently used more than 70 percent of their debt repayment capacity. Nevertheless, debt repayment capacity utilization has been rising for the past 3 years. Further erosion of incomes, expansion of debt use, or an increase in interest rates (e.g., in adjustable-rate mortgages) could further tighten use of credit lines and signal a growing level of financial stress in the sector.

Farm real estate debt is expected to decline slightly in 1999, despite creditors' desire to obtain additional security for loans for any purpose. Nonreal estate debt is also anticipated to decline slightly in 1999.

Standard Financial Performance Measures Vary by Typology

The financial condition of farm operator households and the financial performance of farms they manage differ considerably among household units. Analysis of 1998 ARMS data illustrates the diversity of U.S. farm operations, as evidenced by comparison of farm operator households classified by ERS' farm typology. This classification system

Rising debt repayment capacity utilization remains below 1980's level

recognizes the increasing contribution of income from offfarm sources to the financial well-being of farm operator households, especially those with limited farm sales.

Application of farm business financial performance measures to operations in various typology classes reveals notable differences among farms in various typology groupings (table 8). When off-farm income is excluded from the analysis, overall financial performance measures indicate that over 58 percent of all farm operator households were in a favorable financial position, based solely on farm income. Over 60 percent of small family farms managed by operators that identify farming as their primary occupation were classified as favorable, as were almost 69 percent of retirement farms.

While less than 5 percent of all farms were classified as vulnerable at the end of 1998, almost 10 percent of limited resource farms were considered in this class, as were about 6 percent of residential/lifestyle farms. Over 51 percent of all vulnerable farms were in the residential/lifestyle class, and nearly 15 percent of vulnerable farms were limited resource. This is to be expected, since many low-sales farms do not produce profits in their farming activities. However, residential/lifestyle farms received average off-farm income of more than \$76,000, suggesting that their financial well-being was not dependent on farm income. In contrast, limited resource farms received about \$13,000 in off-farm income.

About 29 percent of all farms are small farms managed by an operator whose primary occupation is farming. About 4 percent of these were identified as vulnerable, and this group accounted for almost 24 percent of all farms classified as vulnerable.

Standard Financial Performance Measures Vary by Typology

Comparison of farm financial performance measures recommended by the Farm Financial Standards Council reveals differences in viability of farming units in the various typology classes (see page 18 for typology definitions). More than 54 percent of all farms were classified as retirement or residential/lifestyle in 1998. Generally, these operations were able to generate positive net farm income, but did not generate farm income sufficient to provide for positive returns to operators' labor and management. While retirement farms appeared to exercise fairly tight cost control measures, on average, farm income on both retirement and residential/lifestyle farms fell short of covering operating expenses. However, operators of these farms reported substantial off-farm household income, and their motivation in farming may be enjoyment of rural amenities, not maximization of returns to the labor used in their farming operations. Even though retirement and residential/lifestyle farms employed substantial assets and generated positive net earnings from their farming activities, they relied on off-farm income to meet living expenses and keep farm debt levels manageable.

^{1/} Total household income equals off-farm income plus earning of the operator household from farming activities as defined in table 7

Source: USDA, 1998 Agricultural Resource Management Study.

^{2/} Family living expenses include food and household supplies, household rent/mortgage, utilities, appliances, furnishings, nonfarm transportation, medical expenses, insurance, contribution to returement plans, clothing, education, hobbies, recreation, gifts, magazines, charitable contributions, etc.

Generating returns to operators' labor and management is likely to be more critical to the 36 percent of farms that are classified as limited resource and those that are small farms headed by operators whose primary occupation is farming. These operators report a greater commitment of time to farming and less income from off-farm sources. Among these typology classes, average net farm income was negative only for limited resource operations, but farms with sales under \$250,000 reported 1998 farm income insufficient to provide adequate returns to operators' labor and management. These farming units ran negative operating profit margins, and, unable to cover the full economic costs of production, reported negative returns to assets and equity. Limited resource farms generally operate with small asset bases, use little debt financing, and generate fairly low levels of income. Moreover, low levels of working capital suggest that these operations have little cushion for financial emergencies. While the debt/asset ratio for these farms is slightly below the average for all farms, they are generally too small to operate efficiently, and, on average, total household income barely covers family living expenses.

In 1998, operators indicating farming as their primary occupation were likely to manage farms that, on average, also did not generate sufficient income to cover operating expenses, and, therefore, did not produce enough revenue to meet the full economic costs of production. On average, these farms have additional working capital and household off-farm income to contribute to family living expenses and to augment farm income shortfalls.

Farms with sales of \$250,000 or more appear to be viable self-sustaining economic units. They own assets averaging more than \$1 million, have manageable debt levels, generate sufficient farm income to cover operating expenses and economic costs, and have positive rates of return on assets and equity. While over 27 percent of very large farms report debt/asset ratios exceeding 40 percent, this class generates average operating profit margins of 19 percent. While farm households in these classes received average 1998 off-farm income of almost \$42,000, the majority of their income is from farm sources.

Farm Typology Groups Use Differing Levels of Debt Repayment Capacity

Debt repayment capacity utilization (DRCU) for the farm sector, as presented previously, is expected to rise from almost 59 percent in 1998 to over 60 percent in 1999. That measure is defined as the ratio of actual farm debt to the maximum feasible debt that could be supported by the current farm income of the sector. As described there, DRCU provides an historical overview of farmers' relative use of credit capacity from 1970 through the end of 1998.

Data collected in the 1998 ARMS provide for a more detailed analysis of DRCU, allowing the influence of off-farm income, family withdrawals (living expenses), and payment of estimated income taxes to be included in the calculation of income available for debt coverage. The maximum principal and interest payment that a farmer could make based on that income, and the maximum loan that the payment could service, can be estimated more precisely for farmers within each farm typology classification. Comparison of actual total liabilities with maximum debt supportable by income from all sources gives a more comprehensive measure of each respondent's individual DRCU. The analysis does not include any nonfarm debt owed by the farm operator's household.

When the contribution of off-farm income to farm debt service is included, DRCU averaged 31 percent for all farms in 1998 (table 9). Retirement farms owed less than 7 percent of the debt that they could service with current income from all sources, while DRCU for limited resource operations averaged over 56 percent. DRCU for farms reporting the operator's primary occupation as farming averaged less than 50 percent, and that of very large farms averaged less than 41 percent.

Farms can often meet short-term income shortfalls with savings and through orderly liquidation of assets. However, if DRCU exceeds 1.2 (meaning that the operation owes 20 more debt than can be serviced with current income), this debt may be at risk of default. About 31 percent of the operations reporting debt outstanding at the end of 1998 had DRCU greater than 1.2, but these farms owed about 46 percent of all debt. Over 73 percent of indebted limited resource farms were in this high debt group, and these farms owed 80 percent of all debt reported by this typology class. Small farms headed by operators whose primary occupation was farming generally were slightly more likely to be in the high DRCU class, while large and very large farms were slightly less likely to be in this group.

Comparison of 1997 and 1998 ARMS data suggests that, generally, both the number of farms in the high DRCU group (figure 21) and the percentage of total farm debt owed by high DRCU operations (figure 22) declined during 1998. These results suggest a slight improvement in farm financial conditions during 1998. However, data reported by farms in the high-sales primary-occupation-farming group indicated that, while the percent of indebted farms with DRCU greater than 1.20 declined from 36 percent in 1997 to 32 percent in 1998, the share of debt held by these high DRCU operations rose from 47 percent to almost 52 percent. Similarly, the number of high DRCU large farms remained at about 25 percent of indebted farms in this group, but the share of debt owed by these operations rose from 36 percent in 1997 to more than 42 percent in 1998.

These results suggest that declining 1998 commodity prices had not, through the end of the year, adversely affected either the financial performance of farm operations or their ability to service debt.

Farm Assets and Equity Values Continue Upward Through 1999

Despite the increase in debt in recent years, farm business balance sheets have shown steady improvement throughout the 1990's, especially since 1992. Debt-to-asset ratios have improved, as the 24-percent increase in farm business debt has been more than offset by the 24-percent rise in the value of farm business assets.

The value of farm real estate has risen 23 percent from 1993 through the end of 1999, while farm mortgage balances have increased about 18 percent. As a result, the degree of U.S. farmland leverage has declined substantially, providing most producers with an added equity cushion to lessen the impact of short-term declines in income. However, farm nonreal estate debt has been rising faster than the value of nonreal estate assets. During 1993-99, nonreal estate assets have risen about 4 percent, while nonreal estate debt has increased 26 percent.

Farm Real Estate Value Growth Moderates

Farm real estate, which represents the largest component of farm assets, is expected to increase in value in 1999, partly due to favorable returns to assets and relatively low inflation and borrowing costs. Although the increase will be relatively small compared with previous years, the higher value of farm real estate should reflect the counterbalancing of lower prices in areas where agricultural uses dominate transactions and those areas where land values are increasing due to urban pressure and other factors.

Farm income is still strong enough across the country to maintain farmland prices. The value of U.S. farm business assets and equity is expected to continue upward through 1999. Although commodity prices in 1999 have generally fallen from 1998 levels, government payments have helped support returns to farm assets.

Equity Rises Slightly

Farm business equity is expected to rise as farm asset values rise more rapidly than farm debt. Equity by the end of 1999 is expected to be \$900.0 billion, \$8.6 billion above 1998, and nearly \$83 billion greater than in 1985 (figure 23). The value of farm business equity represents a large amount of economic wealth. As a comparison, the agricultural sector's

The estimates of the value of U.S. farm business assets, debt, and equity are based on the latest available data, but are preliminary estimates. Final estimates of the farm business balance sheet, including the balance sheets for the 50 States, are not yet complete.

total assets are equal to twice the reported assets of the Nation's three largest automakers.

The long-term farm equity comparison is a little different if the numbers are adjusted for inflation. Real farm equity in 1999 deflated by the GDP chain-weighted price deflator is forecast at \$755.7 billion. In 1986, by comparison, farm equity had an inflation-adjusted value of \$705 billion. The peak of almost \$1,351 billion occurred in 1980. Consequently, farm sector wealth entering 1999 is 44 percent below the inflation-adjusted value of farm equity in 1980.

Farm Financial Ratios Remain Favorable

U.S.-level farm financial ratios measuring profitability, solvency, liquidity, and efficiency generally remain favorable relative to 1998 (see Appendix tables 7 and 8). This reflects moderate growth in farm assets, farm equity, and returns to farm assets, as well as relatively low borrowing costs and inflation.

Debt-to-Asset Ratio Continues Downward Trend

The debt-to-asset ratio indicates the relative dependence of farm businesses on debt and their ability to use additional credit without impairing their risk-bearing ability. The lower the debt-to-asset ratio, the greater the overall financial solvency of the farm sector. The debt-to-asset ratio is forecast to be 16.1 percent in 1999, compared with 16.2 percent expected in 1998. The share of debt to total asset value has ranged from about 16 to 17 percent, after peaking at 23.0 percent in 1985.

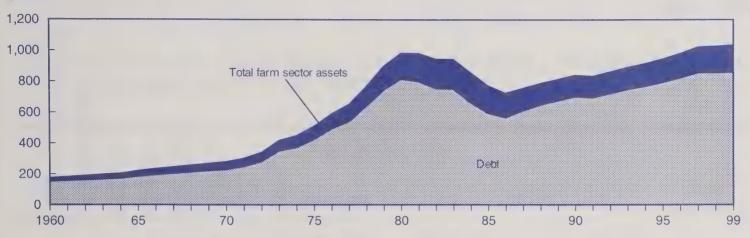

Real Cost of Debt Financing To Rise

The real net return on assets financed by debt, or RNROA, is a profitability measure that includes the real capital gains component of total returns. RNROA equals the total real rate of return on farm assets financed by debt less the real cost of debt. For example, the RNROA for 1999 is forecast at -3.8 (2.2 minus 5.4, Appendix table 6).

The RNROA is an average, and not a measure of the marginal cost of an additional dollar of borrowed funds at the

Figure 23 Equity increasing since 1986

Source: Economic Research Service, USDA.

farm sector level. Nor is it a measure of the marginal cost of funds to an individual farm operator. When the RNROA is positive and debt financing for the Aaverage@ sector farm is profitable, some farm operators will have marginal returns in excess of the marginal cost of debt, while others will have marginal returns less than their marginal cost of debt. For some, additional debt financing will be profitable. For others, it will not. In 1999, since the RNROA is negative at -3.8 percent, additional debt financing is not profitable.

U.S. Farm Asset Values and Debt-to-Net Cash Flow

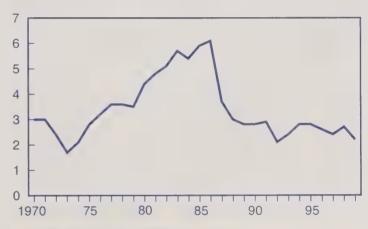

Net cash flow provides an indication of the total resources available to farm businesses for investment in the farm sector, and to meet current debt obligations. Net cash flow expands upon net cash income by accounting for both internal and external sources of funds.

As farm debt and interest expenses have fallen since the end of the "farm financial crisis" of 1980-86, the ratio of debt to net cash flow (after interest expenses) has fallen from as high as 6.0 in 1986 to 2.3 in 1993 (figure 24). The ratio of debt to net cash flow rose from 2.5 in 1997 to 2.9 in 1998, and is forecast to fall to 2.2 in 1999. This is within the relatively low range of 2 to 3 seen over the past 20 years. This means that there was \$2.90 of farm debt per dollar of cash flow in 1998, compared with \$2.20 in 1999. According to this measure, farm investors in 1999 (on average) have somewhat more cash resources per dollar of debt to buy farmland and farm machinery and to meet current debt obligations than the "average" farm investor in 1998.

Land values rise when debt-to-net cash flow is low. The ratio has been relatively low since the late 1980's, and farm-

Figure 24 Debt-to-net cash flow within "historic low" range

Ratio

Source: Economic Research Service, USDA.

land values have risen, reflecting the fact that farm investors have relatively more cash resources to invest in farmland. Also, interest rates (and thus interest expenses) have been low, and returns to farm assets have been relatively strong.

Continued demand for agricultural land along the fringes of urban areas and demand for rural land for recreational purposes are also contributing to the growth in real estate values, especially in the Northeast and in some Western States.

Nonreal estate values are expected to remain at \$233 billion in 1999. The value of farm financial assets is expected to rise slightly. The value of machinery and equipment is expected to decline slightly. The value of crops stored, purchased inputs, and livestock and poultry are expected to remain near 1998 levels.

Low Commodity Prices Contribute to Reduced Farm Income for 1998

Net farm income was \$44.1 billion in 1998, down \$4.5 billion from 1997 and down \$10.8 billion from 1996. Net cash income was \$55 billion, down \$3.5 billion from 1997 and down \$2.6 billion from 1996.

Farmers and the economic health of the agricultural sector endured wide financial swings in 1998. Eighteen months ago our 1998 net farm income forecast of \$42 billion anticipated a financial downturn in the agricultural economy. We highlighted producers specializing in the production of wheat, corn, cotton, and hogs as those most likely to encounter difficulty. By late spring, winter wheat harvest problems were evident in northern parts of the Great Plains. With prospects for larger harvests during the summer, attention turned to grains and oilseeds. Farmers in the South, particularly cotton producers, experienced adversity in 1998 from drought, hurricanes, and flooding. Finally, producers endured dramatic declines in hog prices.

Production flexibility payments and loan deficiency payments under the 1996 Act, combined with supplemental support from last fall's appropriation bill, provided nearly \$13 billion in direct income assistance. These direct payments, \$4.7 billion more than in 1997, as well as reduced expenditures for inputs and increased receipts in some commodity sectors, allowed sector-wide earnings to reach \$44 billion.

Both net farm and net cash incomes fell in 1998. Net farm income, a value of production measure, is the farm operators' share of the sector's net value added from production activities within a calendar year. Net cash income, a solvency measure, is the cash earnings realized within the year that are available to farm operators to meet family living expenses, make debt payments, and replenish and increase the stock of production capital.

Lower commodity prices accounted for much of the decline in the value of U.S. farm production. This was due in large part to falling demand for exports and increased supplies in other exporting countries. Major field crops were particular affected.

Cash Receipts

The value of crop production fell \$10.2 billion in 1998 to \$102 billion. Because there was little change in the volume of inventories held by farmers, sales of crops, which are reflected in cash receipts, accounted for most of the change.

Crop receipts fell \$8.9 billion, with feed crops contributing 47 percent of the decline (figures 25 and 26). Corn alone accounted for \$2.8 billion of the decline, with sorghum and hay contributing another \$600 million each. Oil crop receipts were down \$2.5 billion, all of which was due to lower soybean sales, and food grain receipts fell \$1.4 billion, due to lower wheat sales. Fruit and nut receipts fell \$1.3 billion while cotton sales fell \$332 million.

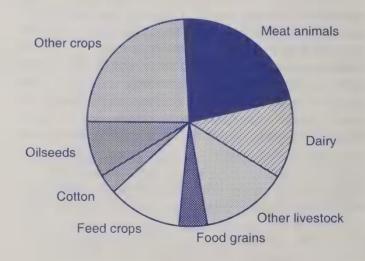

In contrast, vegetable receipts rose a modest 2.5 percent but vegetables account for only a little under 8 percent of total cash receipts. No single vegetable accounted for as much as 1 percent of total cash receipts.

Livestock Receipts Diverge

In 1998, the value of livestock production was down \$2.3 billion from 1997 to \$94.5 billion. However, this total masks the sharply contrasting livestock subsectors. Receipts for meat animals were down 12 percent, with sales of hogs and cattle declining 28 percent and 6.3 percent, respectively. These drops were in contrast to dairy, where the \$3.4-billion

Figure 25

Composition of 1998 cash receipts

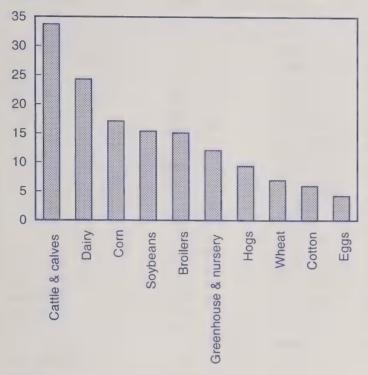

Source: Economic Research Service, USDA.

Figure 26

Top 10 commodities by value, 1998

Source: Economic Research Service, USDA.

increase in sales (up 16 percent) offset more than half of the drop in meat animal sales. Poultry sales were also up by more than half a billion dollars.

Supplies of hogs were large in 1998, reflecting the structural changes occurring within the subsector. The number of hogs produced under production contracts has expanded greatly in recent years. The contractee usually assumes market price risks for the hogs, but, as opposed to broilers, some hog production contracts are written with both contractor and contractee sharing in risk.

The cattle herd declined for the third consecutive year as producers continued to liquidate their herds in order to reach a balance with demand that will improve profitability. The large supplies of hogs and resulting low pork prices held down retail beef prices.

There was little change in receipt rankings (table 10). The most obvious was the drop in hogs' rank due primarily to lower 1998 hog prices.

Government Payments Were a Significant Component of Revenues for 1998

Government payments for 1998 changed substantially due to: 1) the importance of loan deficiency payments for 1998 crops, 2) a change in rules providing farmers the opportunity of taking 100 percent of fiscal year 1999 production flexibility payments in calendar 1998, and 3) supplemental

support for agriculture in the "Omnibus Consolidated and Emergency Supplemental Appropriations for Fiscal Year 1999." Government payments for 1998 were \$12.2 billion, up significantly from \$7.5 billion in 1997. Not since 1993 (\$13.4 billion) had payments been near this level.

Loan Deficiency Payments: For the first time under the 1996 Farm Act loan deficiency payments emerged as an important source of government payments. Posted county prices for major commodities in many locations dropped below the loan rate, making farmers eligible for loan deficiency payments. There were expectations that a significant share of corn production would qualify for loan deficiency payments with an average national price just slightly above the loan price of \$1.89. In fact, loan deficiency payments, at an average of \$0.18 per bushel, were paid on 57.9 percent of the corn production. Overall, farmers were eligible for loan deficiency payments on 1998 crops of \$2.8 billion, \$1.8 billion of which was received by the end of calendar year 1998.

Rule Change on Production Flexibility Payments: The 1996 Farm Act's production flexibility payments were pegged to a declining budget allocation. Regardless of commodity prices, participants would have received about \$5.6 billion from fiscal year 1999 funds. To estimate 1998 calendar year payments (from fiscal year budget allocations) it was assumed that 20 percent, or \$1.2 billion, of the next year's payment would be taken before December 31. Legislation late in the summer of 1998 changed the rule so that farmers could elect to take all of their fiscal 1999 production flexibility payments in calendar 1998 (as opposed to the 50 percent allowed in the 1996 Farm Act). It was expected that farmers—particularly those affected most by weather disasters and lower prices for grains and soybeans—would take advantage of additional fiscal 1999 payments available in 1998.

It turns out that the percentage of fiscal year 1999 production flexibility payments made in 1998 was around 20 percent, slightly higher than previous years. The provision allowing farmers to take all of the payments before December 31 might have been more widely used had there not been additional funding provided in the fiscal year 1999 Supplemental Appropriations Act passed in October 1998.

Fiscal Year 1999 Supplemental Appropriations Act: Almost \$6.0 billion of new funding for the agricultural sector was provided in the "Omnibus Consolidated and Emergency Supplemental Appropriations for Fiscal Year 1999." The bill, passed in October 1998, included about \$5.6 billion that can be considered direct government payments. About half of that amount was intended as supplemental payments to help offset the loss of overseas markets and subsequent lower commodity prices. The remainder was appropriated as disaster payments to assist farmers suffering crop losses due to severe climatic conditions. An amount of \$2.8 billion was disbursed in one-time supplemental payments by the end of

calendar 1998 (distributed proportionately to production flexibility payments). The bulk of the remaining funding is intended for disaster payments and will likely be disbursed during calendar 1999.

Aggregate Production Expenses Little Changed.

Total farm expenses dropped minimally to \$167.8 billion in 1998, from \$169.0 billion in 1997. Increases in some categories (e.g., hired labor and custom work) were offset by declines in others (e.g., farm-origin and manufactured inputs) as farmers sought to adjust to the crosscurrents of economic forces buffeting them. Favorable macroeconomic forces also benefited farmers, resulting in an absence of inflationary forces in the general economy, which portends stable prices for a broad array of purchased inputs. The relatively low fuel prices and interest rates were particularly beneficial.

Low prices that affect one segment of the agricultural sector can benefit another. Extraordinarily low prices received by producers of feed grains translate into low feed costs for livestock producers. The value of livestock production declined only 2.3 percent in 1998 in contrast to the 9.1-percent drop in crop production.

The Economic Fortunes of States Varied Widely in 1998

North Dakota's 1998 net farm income rebounded 482 percent from the low of 1997 to exceed its 1990-97 average by 13 percent (table 11). In 1997, the State's farm sector suffered a dramatic 88-percent decline in net farm income. Wheat typically accounts for at least 30 percent of the State's agricultural production and its farmers encountered significant production problems as well as the low wheat prices experienced by all wheat producers.

Prices of hogs, soybeans, and corn were low by recent historical standards at the beginning of 1998 and declined throughout the year. Corn and soybeans are the two leading crops in terms of sales receipts and hogs rank third in terms

^{1/} Total value of all commodities and services produced in the sector.

^{2/} Final sector output less intermediate consumption outlays, net government transactions, capital consumption.

^{3/} Net value-added less payments to factors of production and is residual returns to operators.

of livestock receipts. Producers of these three commodities absorbed a substantial drop in income. The effects are clearly evident in the net farm incomes for Iowa, Illinois, and Indiana, where corn, soybeans, and hogs are the leading commodities. Net farm income in all three States fell more than 30 percent.

Milk prices climbed significantly through most of 1998 and dairy States experienced a reversal of fortunes. Milk prices were low in 1997 and States in which dairying is a leading component of their agricultural economy tended to suffer substantial declines in farm income. States in the Great Lakes region and Northeast generally fall into this group, with Wisconsin and New York being prime examples.

North Carolina and California—States that have tended to be immune to declines in farm income in recent yearsexperienced 1998 income losses of 29 percent and 17 percent, respectively. North Carolina ranks second in the production of hogs and tobacco, and its sales of these commodities fell 36 percent and 17 percent, respectively. The decline in hog receipts was due to low prices, but tobacco production declined when the assignment of marketing quotas was reduced in response to diminished demand.

Fruit and nuts produced in the Pacific Coastal States were affected by weak export demand following the economic turmoil in Asia. California accounts for all sales of almonds and walnuts and 92 percent of the grape sales. The combined sales of these three commodities declined \$1.1 billion in 1998. Cotton sales declined \$332 million, two-thirds of which occurred in California.

Recent analysis of Agricultural Resource Management Study (ARMS) survey data has shown a significant reduction in the percentage of feed crops used on farms where produced. The rapid structural change occurring in the livestock sector with regional shifts in production and consolidation into large operations (e.g., hogs in North Carolina and dairy in California) has led to a higher percentage of feed being purchased as opposed to being grown on the farms producing the livestock. Consequently, the share of feed crops sold on the open market is higher. For example, in 1996, the percent of corn used on farms where produced was revised from 20.46 percent to 16.73 percent. With a corn crop in excess of 9 billion bushels, this translates into an additional 350 million bushels of sales.

Placing the Income Situation in Context

There is a natural tendency to compare the farm income levels of recent years to those in 1996 because that was the last year of the traditional farm programs and farm income was at a very favorable level. To retain perspective, it must be remembered that 1996 was a truly exceptional year with record yields for major crops and prices that remained unusually high, given the large production levels.

Growth in the economies of Southeast Asia in 1995, 1996, and the early months of 1997 translated into demand for U.S. agricultural products and helped support commodity prices and boost farm income. These economies began to falter in the summer of 1997 and have yet to fully recover, which has depressed demand for U.S. agricultural commodities.

In 1998, economic difficulties in Japan led to a substantial depreciation in the yen, which has curtailed Japan's demand for imports and simultaneously lowered the prices of Japanese exports. These consequences of the declining yen mirror those resulting from sinking currency values in Southeast Asia and in larger countries such as Russia and Brazil.

Because the U.S. dollar is the currency to which individuals and companies in other countries seek to convert their capital in periods of economic crisis in order to avoid having its value depreciate along with the local currency, the dollar appreciated in value against the currencies of most of these countries. The consequence was a relative rise in the export price of U.S. agricultural products accompanied by a drop in demand in potential importing countries and a decline in competitiveness with other exporting countries.

Net farm income is a production based measure, and both the quantities of production and the market price are key determinants. Abundant supplies definitely depress prices but in turn mitigate the decline in farm income.

Net cash income is a solvency measure of cash earnings generated from business activities within the calendar year and thus available to meet family living expenses and make debt payments. It does not allow for replacement of capital stock consumed but does indicate if farmers can stay afloat. Normally, in years of lower prices, farmers maintain cash earnings by drawing down inventories. Crop harvests were big in both 1996 and 1997 and farmers carried over substantial stocks into 1998. When profit potential appears limited, farmers also reduce their cattle herds, which is reflected as livestock inventory liquidation and has occurred in each of the last 3 years.

Production Costs Rise Moderately Except for Livestock

Lower overall input prices helped farmers and ranchers in 1998. Livestock producers were especially helped by lower feed costs, although this meant reduced receipts for feed grain producers.

Acres planted to the 17 major U.S. crops declined 2.1 percent in 1998 and farmers and ranchers saw input prices fall an average 3.4 percent. Crop input prices on average were essentially unchanged from 1997 while livestock input prices fell 3.4 percent. There was wide variation in the prices of individual inputs, however.

Feed prices were down an average 12 percent for the year. This benefited livestock producers because of lower costs of production but had an adverse effect on feed crop producers because of lower sales. Producers of crops that are heavy fertilizer users, like corn, benefited from the 7.4-percent decrease in fertilizer prices and everyone benefited from the 17-percent drop in fuel prices.

ERS Institutes New Accounting And New Regions

The costs and returns estimates for some commodities will appear different this year than in the past. For corn, soybeans, cotton, peanuts, and cow-calf enterprises, ERS is revising its accounting methodology to conform with the new standards recommended by the American Agricultural Economics Association (AAEA) Task Force on Commodity Costs and Returns. For these same commodities, ERS is publishing regional estimates using new resource regions.

At a 1991 national meeting of agricultural economists from academia and government, statisticians, political scientists, extension workers, and farmers, there was a consensus that the profession needed a uniform set of standards for estimating commodity costs and returns. A task force was formed in 1992 "to recommend standardized practices for generating costs and returns estimates for agricultural commodities after a careful examination of the relevant economic theory and the merits of alternative methods." 2 After 6 years of study, the final recommendations have been issued.

As the major source of commodity costs and returns estimates for U.S. agriculture, ERS has fully supported the work of the Task Force and has been collecting data for 3 years in anticipation of adopting the recommended accounting practices. Beginning with this issue of Agricultural

Income and Finance Situation and Outlook, ERS will start publishing estimates using the new methodology and new reporting format where data are available (tables 12 and 13). Cost distributions for corn, soybeans, cotton, and peanuts for their survey year are also presented. In all future surveys, ERS will include questions that provide the necessary information for adopting the new methods. Next year, wheat and hog estimates will be converted to the new methodology.

In addition to the new accounting standards and for the five commodities listed above, ERS is also changing its reporting format to publish regional estimates using the new resource regions (for a description of the Land Resource Regions, see page 12). Their use will allow more standardization among commodities for comparing production costs and returns across regions. As with the new accounting standards, ERS will convert to the new regions for individual commodities as they are surveyed in the future.

Distributions of total U.S. costs of production for selected crops

Using ERS' new methods for estimating production costs, a cost curve can be drawn to show how costs are distributed across farming operations. Costs are on a dollar-per-unit basis using farmers' expected yields rather than actual yields. Expected yields are used so that effects of weather and other unusual events can be factored out and to give the distributions some permanence over the short run. Each curve represents costs for the year in which farmers were surveyed through USDA's Agricultural Resource Management Study.

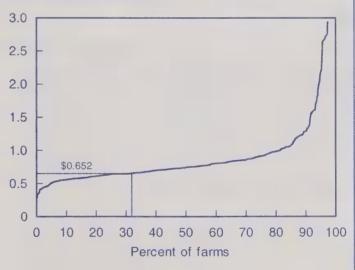

- Excluding government payments, corn growers in 1996 received an average price of \$2.71 per bushel. At this price, 55 percent of surveyed growers were able to cover total operating and allocated overhead expenses. With additional government payments, program participants would have been able to receive higher returns with more growers covering costs.
- Soybean growers in 1997 received an average price of \$6.50 per bushel. At this price, 68 percent of surveyed growers would have covered total costs.
- Cotton prices fell in 1996 and 1997, averaging 65.2 cents per pound in 1997. At this price, only 32 percent of growers would have covered total production costs. The median cost of surveyed cotton growers was 72 cents per pound.
- Peanut growers received an average 28.3 cents per pound in 1997, meaning 80 percent of growers were able to cover total costs. Peanuts, however, are grown under a quota system with minimum support prices.

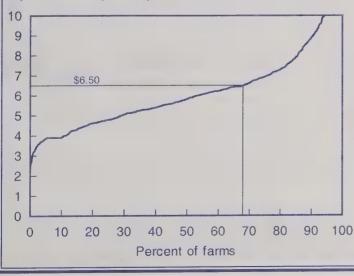

\$ per pound expected yield

Costs and Returns by Commodity

The average **corn** value of production less operating costs in 1998 fell 21 percent from a year earlier to \$109.90 per acre, due primarily to the drop in corn prices as U.S. farmers harvested their second largest corn crop. Corn yields increased an average of 6 bushels per acre from the prior year while harvested acres increased about 1 percent. Increased corn supplies outstripped increased demand, reducing harvest-period corn prices 24 percent to \$1.91 per bushel. Total corn production costs fell 85 cents per acre as the drop in operating costs slightly exceeded the increase in allocated overhead costs.

Falling fertilizer prices mainly drove the 1998 decline in corn operating costs. The corn crop uses more fertilizer than any other U.S. crop and fertilizer is the major component of the corn operating costs. The drop in fertilizer costs was partially offset by increases in the opportunity costs of land and increases in the capital recovery of machinery and equipment. Breakeven analysis reveals that \$1.14 per bushel was needed in 1998 to cover corn operating costs, while \$2.64 per bushel was needed to cover total corn production costs (appendix table 8). In comparison, the harvest-period price of \$1.91 per bushel was just slightly above the loan rate of \$1.89.

While corn yields were up for much of the country due to good weather conditions, corn producers in the Southern Seaboard and Fruitful Rim regions saw sharp drops in yields due to heat and drought. Some of their corn was contaminated by aflatoxin, limiting its usefulness in the marketplace. Southern Seaboard corn growers just covered their operating costs. The national impact of the reduced corn yields in these two regions was limited since farmers in these regions produce a relatively small share of the U.S. corn crop.

Record 1998 soybean acreage, spurred in part by a favorable loan rate for soybeans relative to other crops, was an important factor leading to large 1998 supplies that soon put downward pressure on market prices. On average, 1998 harvest-time soybean prices dropped 20.6 percent from 1997. Yield per planted acre remained high, matching 1997's 43 bushels per acre. Despite the high yield, the dramatic decline in prices from 1997 reduced gross value of production by 20 percent. With no significant change in costs of production and no change in yield, breakeven prices to cover operating costs and prices to cover total costs changed little on a national basis. However, the sharp reduction in market price at harvest prevented producers, on average, from covering total costs in 1998.

Producers in most regions except the Southern Seaboard and Mississippi Portal were able to cover total costs in 1997. Whereas producers in other regions benefited from high yields in 1997 when harvest prices were much higher, yields in the Southern Seaboard and the Mississippi Portal were 72 percent of the national average. In 1998 yields in the

Southern Seaboard approached the national average. Yields in the Mississippi Portal fell even further to 25 bushels per planted acre—58 percent of the national average. Persistent hot, dry conditions after planting stressed the crop. About 19 percent of the crop is irrigated in this region.

Area planted to **cotton** continued to fall across the United States in 1998. In California area declined 215,000 acres as wet, cool weather delayed planting. Some 36 percent of acreage in Texas was not harvested as drought and high temperatures led to large abandonment. Torrential rains delayed harvest in South Texas while Delta growers had to contend with two hurricanes and a tropical storm. Total lint production was down about 27 percent with the largest losses in Texas and California. Production rose in Alabama and North Carolina.

Gross value of cotton production fell 30 percent from 1997 to 1998 ranging from \$204 per acre in the Prairie Gateway to \$528 per acre in the Mississippi Portal. The breakeven price for operating costs ranged from 40 cents per pound in the Mississippi Portal and Southern Seaboard to 80 cents in the Fruitful Rim. Yields in the Fruitful Rim were only half the 1997 level (and breakeven costs were 46 cents). In terms of all costs, the Southern Seaboard had the lowest breakeven costs of 72 cents per pound and, aside from the Fruitful Rim, the highest costs were in the Prairie Gateway at \$1.07. All regions covered operating costs while only the Southern Seaboard covered all costs in 1998.

Peanut planted acreage continued to increase from 1997 to 1998. Within the principal growing States, Virginia acreage was unchanged. Peanut growers in North Carolina harvested all their acres planted. U.S. peanut production rose 11 percent in 1998, with yields rising in all States but Oklahoma. Yields rose 13 percent in Georgia and 19 percent in North Carolina due to near perfect growing conditions during most of the season. Texas growers recorded their highest production ever and tied 1997' record yields.

The average operating cost of growing peanuts fell 5 percent from 1997 to 1998 and overhead costs rose about 7 percent. Breakeven costs for peanuts were 12.8 cents per pound for operating costs and 16 cents per pound for overhead. The harvest-month price of 26 cents was just under the 29 cents needed to cover all costs. The Virginia/North Carolina portion of the Southern Seaboard continued to have the highest yields and had a 25-cent breakeven price for all costs. Growers in the Prairie Gateway needed 35 cents to cover all costs.

Dry conditions during the summer of 1998 through much of the southern third of the United States forced a resumption in **beef cow** liquidation. Many beef replacement heifers had already been sold and placed in feedlots during the spring of 1998, reflecting deteriorating forage conditions. Large beef supplies from increased female slaughter and record slaughter weights depressed beef prices during 1998. On average,

the gross value of production declined about 1 percent. However, as grain production rose in the second half of the year, feed ration costs to livestock producers improved. Concentrates and other feed expenses declined an average of almost 8 percent from a year earlier.

Concerns about lower **wheat** prices in relation to those for corn, soybeans, and other field crops affected planting decisions in 1998. The market year wheat price received by farmers dropped for the third year in a row, averaging \$2.70 per bushel in 1998. This was significantly below the \$3.38 in 1997 and the record \$4.30 in 1996. Higher yields in most areas were not enough to cover the lower prices, causing net returns to fall for the year. At an average yield of 39.67 bushels per planted acre, farmers saw a breakeven cash cost of production of \$2.30 per bushel.

Rice prices at harvest fell significantly from 1997 to 1998 and yields on average dropped moderately. As a result, gross value of production decreased and the decline more than offset reduced costs. Lower fertilizer and fuel costs accounted for the lower costs per planted acre. Net cash returns declined from \$134 per planted acre in 1997 to \$76 in 1998. California showed the largest yield decrease. Early season crop development was later than normal due to cold, wet spring weather. California harvest prices, however, increased from 1997 to 1998. The lower yield offset the rise in prices and gross value of production fell accordingly. Breakeven prices at harvest were \$7.96 per cwt for cash costs and \$12.02 for total economic costs, compared with a harvest-month price of \$9.35.

The Mississippi Delta region had the lowest cash expenses and total operating costs per acre in 1998 and California had the highest. California had the highest yield per acre and shared the highest market price with the Gulf Coast region. Breakeven prices at harvest for the Mississippi Delta region were \$6.45 per cwt for cash costs and \$9.92 for total economic costs compared with a harvest-month price of \$9.20. California breakeven prices were \$9.76 and \$14.61 compared with a harvest-month price of \$9.64.

Despite a decline in production, 1998 barley prices were lower than in 1997. Plentiful supplies of other feed grains, primarily corn, and weak export demand for all feed grains led to a barley price of \$1.95 per bushel, down from \$2.38 in 1997. Yields rose marginally in the Northern Plains, but net returns tended to decline.

Area planted to **sorghum** declined almost 5 percent in 1998. However, in Texas, acreage increased almost 6 percent due to drought there (sorghum is highly drought-resistant compared with other crops), but less than two-thirds was harvested

because of continuing drought. Nationally, production fell nearly 20 percent from 1997, with the largest losses in Arkansas (38 percent), Oklahoma (32 percent), and Texas (43 percent). In contrast, yields per harvested acre were essentially unchanged in Kansas (up 2 percent) the leading sorghum State, and increased in Nebraska (16 percent).

In spite of lower production, sorghum prices continued to fall in 1998, averaging \$1.71 per bushel. Although cash costs fell 10 percent per acre, gross value of production fell 38 percent per acre. At the average yield of 56 bushels per planted acre, farmers' breakeven costs of production were \$1.76 per bushel for cash costs and \$2.88 per bushel for economic costs. Growers in the Central Plains covered their cash costs, but residual returns were negative.

Gross value of production for **oats** was lower in 1998 than in 1997 because of lower prices and lower yields. Expenses were also down because of reduced fertilizer and fuel costs. With the drop in gross value exceeding the decrease in costs, net returns fell 45 percent. Residual returns to management and risk declined from 1997 for all regions. Net cash returns remained positive in all regions.

Sugar beet yields rose about 6 percent in 1998, pushing up receipts and returns for the year.

Monthly hog prices ranged from \$42 to nearly \$60 per cwt during 1997, but dropped sharply late in 1998. Market hog prices began 1998 around \$35 per cwt and moved to \$43 at midyear but fell to less than \$15 by December. Feeder pig prices were over \$70 at the start of 1998, but declined to less than \$40 per cwt by year's end. As a result, the value of market hogs and feeder pigs declined about 35-40 percent from 1997. Hog production costs were also lower in 1998 due mainly to a decline in corn and soybean prices. Feed costs in 1998 were almost 20 percent less than in 1997, while total variable costs were about 15 percent lower. Despite lower production costs, returns above cash costs were down about \$15 per cwt on farrow-to-finish operations, \$32 per cwt for feeder pig producers, and \$12 per cwt for hog finishers. The record low prices late in 1998 caused USDA hog cost and return accounts to show negative average returns above cash costs for the first time ever.

Dairy concentrate expenses dropped 10 percent in 1998 as available supplies increased from a year earlier. In addition, with milk prices reaching record highs, returns over concentrate costs were very high compared with recent years. Consequently, cash returns to dairying in 1998 increased in all six regions. After showing negative cash returns in 1997, the Corn Belt and Northeast regions posted cash returns of \$3.00 and \$1.99 per cwt of milk sold in 1998, respectively. At the U.S. level, cash returns increased from only 65 cents per cwt of milk sold in 1997 to \$3.42 in 1998. These improved returns should spur expanding producers to pick up the pace.

³ Cost estimates and cost-return relationships were prepared using ERS' traditional estimation methods. Estimates for wheat, barley, sugar beets, hogs, and dairy will be converted to new estimation methods as data are collected through annual farm surveys.

F= forecast. 1/ Value added to gross income. Value added to net farm income equals difference in net farm income and returns to operators. 2/ Includes landlord capital consumption. 3/ Statistics in and above the Net Farm Income line represent the farm sector, defined as including farm operators dwellings located on farms. Statistics below the Net Farm Income line represent only the farm businesses to the exclusion of the operators dwellings.

^{4/} Returns to operators is equivalent to net farm income excluding the income and expenses associated with farm operators dwellings.

^{5/} Excludes landlord capital consumption.

- P = Preliminary. F = forecast. n.a. = not available. = The relative standard error exceeds 25 percent, but is no more than 50 percent.
- 1/ This table derives farm operator household income estimates from the Agricultural Resource Management Study (ARMS) that are consistent with Current Population Survey (CPS) methodology. The CPS, conducted by the Census Bureau, is the source of official U.S. household income statistics. The CPS defines income to include any income received as cash. The CPS definition departs from a strictly cash concept by including depreciation as an expense that farm operators and other self-employed people subtract from gross receipts when reporting net cash income.
- 2/ A component of farm sector income. Excludes income of contractors and landlords as well as the income of farms organized as nonfamily corporations or cooperatives and farms run by a hired manager. Includes the income of farms organized as proprietorships, partnerships, and family corporations
- 3/ Consistent with the CPS definition of self-employment income, reported depreciation expenses are subtracted from net cash income. The ARMS collects farm business depreciation used for tax purposes.
- 4/ Wages paid to the operator are subtracted here because they are not shared among other households that have claims on farm business income. These wages are added to the operator household's adjusted farm business income to obtain farm self-employment income.
- 5/ Gross rental income is subtracted here because net rental income from the farm operation is added below to income received by the household.
- 6/ More than one household may have a claim on the income of a farm business. On average, 1.1 households share the income of a farm business.
- 7/ Includes net rental income from the farm business. Also includes net rental income from farmland held by household members that is not part of the farm business. In 1994 net rental income was collected as part of off-farm income.
- 8/ Wages paid to other operator household members by the farm business and net income from a farm business other than the one being surveyed. Beginning in 1996, also includes the value of commodities provided to household members for farm work.
- 9/ Wages, salaries, net income from nonfarm businesses, interest, dividends, transfer payments, etc. In 1994, also includes net rental income from farmland. 10/ From the CPS.

1/ 1997 estimates are revised. 1998 estimates are preliminary. Sugarbeet prices are held at the 1997 level because State-level prices for the 1998 season will not be available before January 2000. 2/ Yields are those reported in USDA's 1992 Farm Costs and Returns Survey of sugarbeet growers adjusted for year-over-year changes as reported by NASS/USDA in Crop Production, 1998 Summary, January 1999. Note: Sugar beet regions defined as: Great Lakes (Michigan, Ohio), Red River Valley (Minnesota, eastern North Dakota), Great Plains (western North Dakota, Montana, Wyoming, Nebraska, Colorado, Texas), Northwest (Idaho, Oregon except Klamath County), and Southwest (California, Klamath County of Oregon). For the latest in commodity and regional coverage.

Visit the ERS website for up-to-date outlook coverage of major commodities, the U.S. farm economy, and agricultural trade, and for key country and regional agricultural reports emphasizing trade developments.

Reports on major field crops and livestock are issued monthly.

For the latest news on a specific commodity or topic, select from **Outlook Reports**. These include monthly electronic releases on the major field crops and animal products, and periodic reports for specialty crops, U.S. farm income and finance, and regional coverage.

For a roundup of the current marketing year's events select from **Annual Yearbooks and Reports** on a number of major crops. These reports feature special articles on timely topics, and statistical tables with official government data on prices, production, use, and trade.

Free e-mail subscriptions are also available. Click on "Periodicals" then "E-mail subscriptions" on the ERS home page, and follow the instructions.

Printed copies of a number of reports are available. Call 1-800-999-6779 for information on ordering printed copies.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, and marital or family status. (Not all prohibited bases apply to all programs). Persons with disabilities who require alternative means for communication of program information (braille, large print, audiotape, etc.) should contact USDA's Target Center at (202) 720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 14th and Independence Avenue, SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice or TDD). USDA is an equal opportunity provider and employer.
